

GUI vs. CLI

GUI (Graphical User Interface) is the visual interface that you can see simply, for example, an app or a button you would click. While CLI (Command Line Interface) is the more complex version having you write out what you want to happen through types of code or commands. GUI is good for the average user because it is simple and to the point and isn't overwhelming to use while CLI has a lot going and it is hard to do multiple things at once. Though using CLI you can do more things since you have the freedom to choose what you want to do because an app only lets you do so much.
